

VMI-Hybrid V2

This is a QR code; you can scan it with a smart phone or other barcode reader to visit the support area of our website.

Quick Start guide:

Unpacking the machine

You will find all the complimentary consumables that come with the VMI-Hybrid V2 unit in the consumable tray on top of the machine.

Please retain all packing material

Installing the Consumables

Install the 500 minute consumable chip:

Slip the 500 minute consumable chip into the RS232 port located on the left side at the front of the machine.

Install the buffing solution and water bottle:

Fill the water bottle with normal potable water and insert the bottle into the bottle box at the back of the machine. The thinner of the two tubing pieces in the bottle box should be inserted into the water bottle.

Next, install one of the two compound bottles that accompanied the machine.

Shake compound bottle vigorously, first!

Install the Water and Compound bottles

Install the pads and centre hub:

Before you can install the pads, the Lid Stopper must be removed. Once removed, gently allow the top cover to spring into the furthest back position.

Each pad is labelled "L" for Left & "R" for Right.

Attach each pad to the corresponding pad holder and attach the centre hub to the hex shaped post.

Installing the Pads and Centre Hub

Ensure Jet Nozzle extenders are in place

The Jet Nozzle Extenders are important in ensuring the compound and water are dropped as close the disc as possible, during a cycle. These come already installed in the Hybrid V2 unit.

The VMI-Hybrid V2 unit can now be powered on, once you have connected the Power cable.

Prime the Compound and water lines

Press and release the C & W buttons until the nozzles are producing fluid. Press these buttons again to stop the pumps.
